

Requirements (from Aaron 4.29.08)

to build:

- initiation
- response
- media insertion
- modal transferrance
- dispersion

dispersion is effected through two questions:

1. would you like to forward your request to certain people? (email and sms)
2. would you like divvy to forward your request to an auto-list of vendors that match your tags? care to provide some additional criteria?

a request is generated two ways:

1. through a basic 'i want to verb a noun', with a 'add more' slide out tray.
2. by snagging a request (click on 'borrow a thing', auto-request for 'lend a thing' is generated, unless, of course, you snag your own request)

request verbs (for now) are:

1. buy / sell
2. borrow / lend
3. rent / rent out
4. get / give
4. co-op

left side of stream = live stream or requests (filtered or unfiltered...has an inclusive/exclusive tag and radius filter) right side of stream = eddy of request (includes a 'snag my requests' button)

taking a request from the left side (live stream) to the right side of the screen (eddy) is called 'snagging'

hovering on a request in the stream reveals more information and action buttons

live stream order is based on time. throw requests to the top at each:

1. creation
2. update
3. 'recast'
4. first instance of two-way comms per conversation

a ping is sent by the system to the requester:

1. after a minutes of no session activity for a requester in im mode
2. after b minutes of no session activity for a requester in sms mode
3. after c minutes of no session activity for a requester in email mode

a request is removed from the stream when:

1. a session is terminated with no modal transferrance to a mode other than browser im
2. when the requester fails a ping
3. when a requester deletes it

a conversation is inactive or a poster fails a ping when:

1. more than x minutes have passed when the receiver is in im mode
2. more than y minutes have passed when the receiver is in sms mode
3. more than z minutes have passed when the receiver is in email mode

requests have colors

1. one color for my requests
2. one color for requests which have an active conversation going (after two-way comms are established)

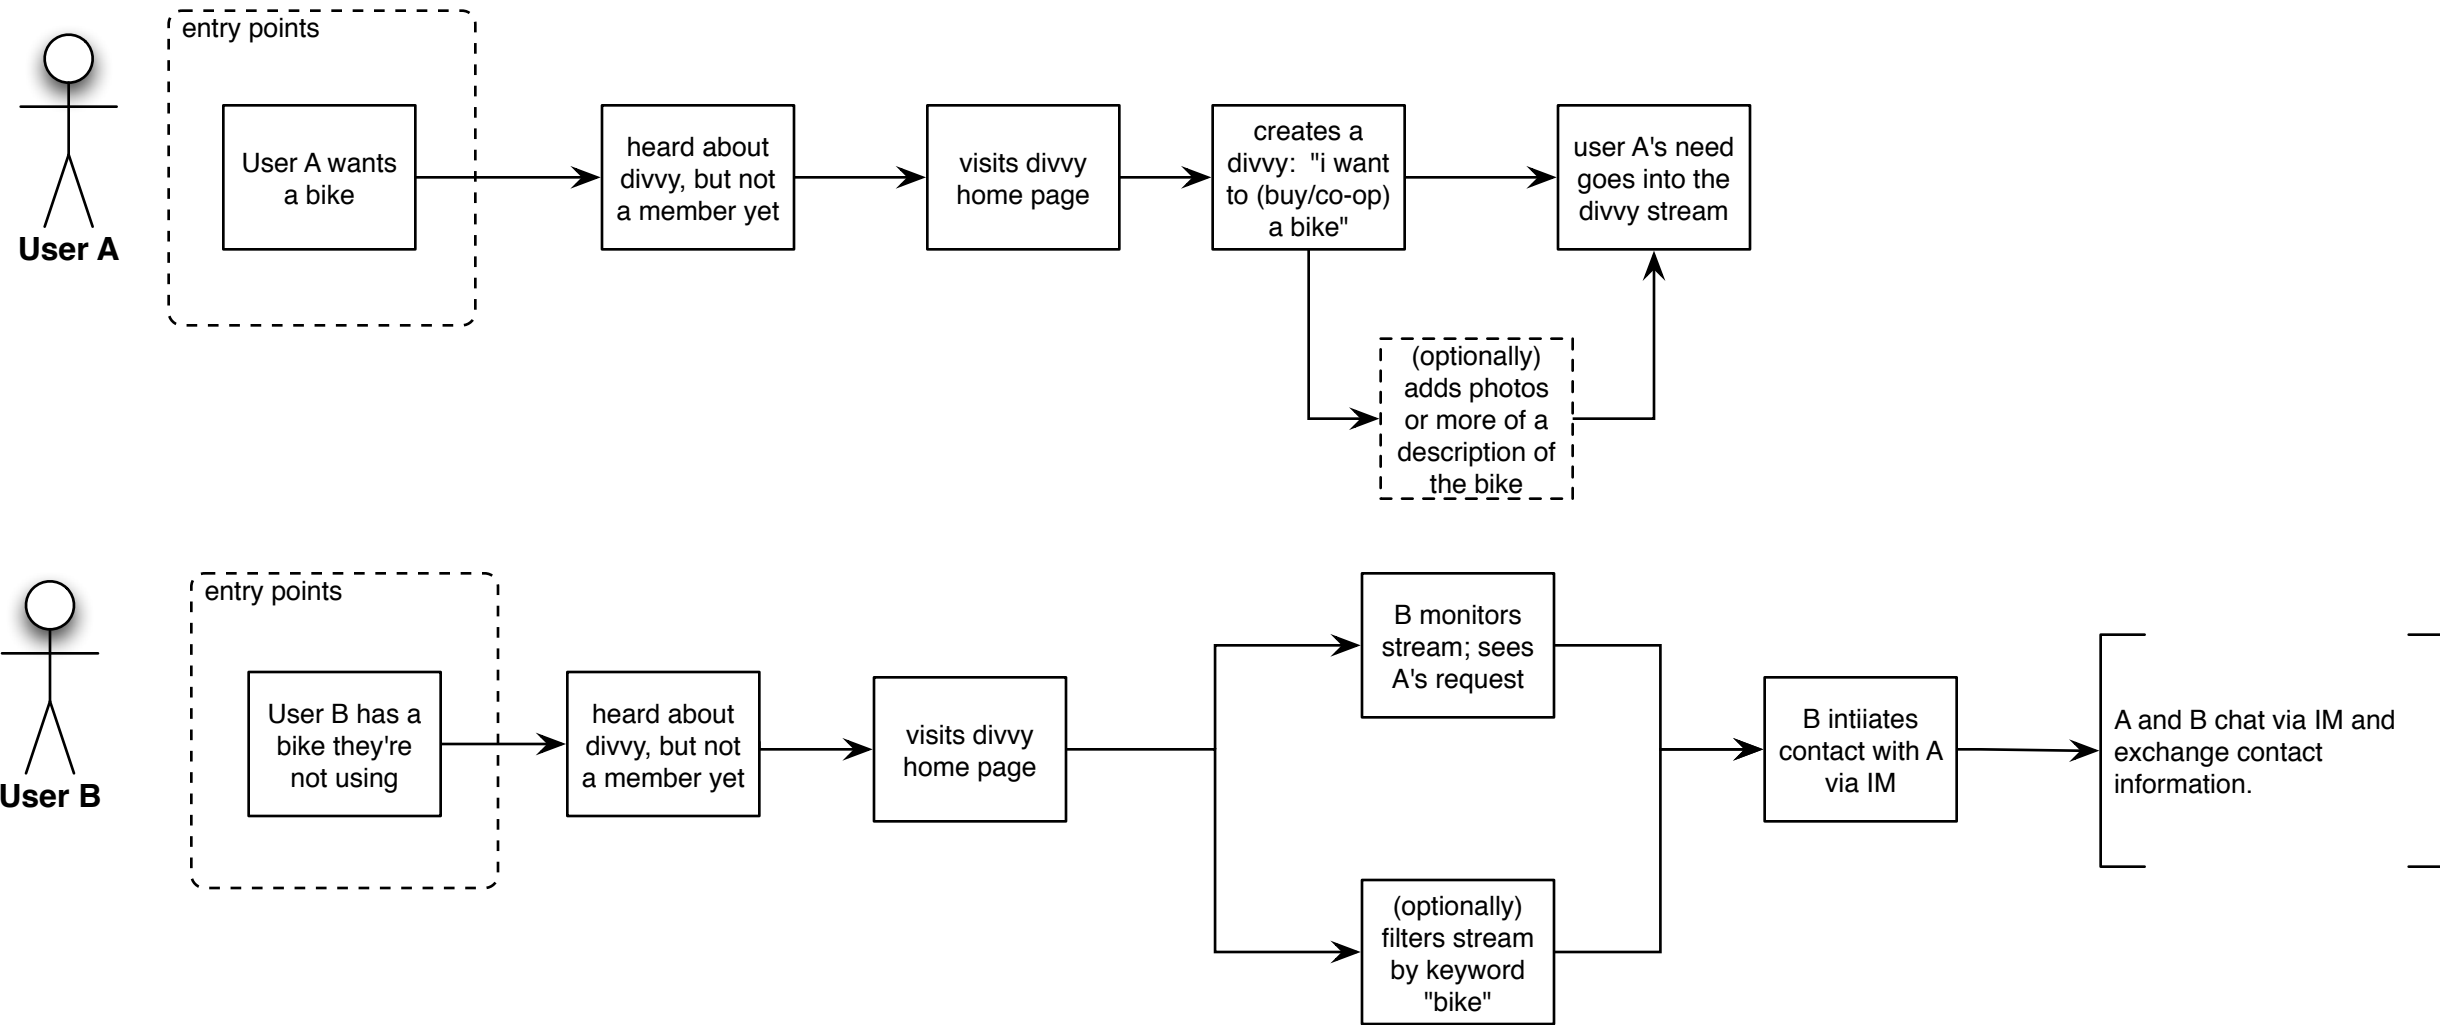

at session termination, divvy steps in (if the user has posts) and asks:

1. modal transferrance (per request or apply all?)
2. dispersion
3. delete request?

at conversation going inactive, divvy steps in and asks:

1. notify you when the ignorer returns?
2. modal transferrance?
3. dispersion
4. delete?

divvylive user flows v. 4.0 - 04.29.08
